Office Action Summary

Application No.

09/837,388

Applicant(s)

LEE ET AL.

Examiner

Jimmy Lin

Art Unit

1762

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 25 July 2006.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 9,10,12-16 and 18-27 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 9,10,12-16 and 18-27 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO/SB/08)
- Paper No(s)/Mail Date 6/9/06.

- 4) ☐ Interview Summary (PTO-413)
- Paper No(s)/Mail Date. _____.
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____.

DETAILED ACTION

Definitions

1. "Letterpress" is defined by Merriam-Webster's Collegiate Dictionary, 10 edn., as "the process of printing from an inked raised surface esp. when the paper is impressed directly on the surface" (in contrast to "intaglio": "printing (as in die stamping and gravure) done from a plate in which the image is sunk below the surface"). "Flexography" is defined as "a process of rotary letterpress printing using flexible plates and fast drying inks".

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

4. Claims 9-10, 12-16, 18, 20, 22, 25, and 27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pei et al. (U.S. Patent 5,682,043, hereafter '043) in view of Wright (U.S. Patent 3,661,081, hereafter '081), Shinoda (U.S. Patent 5,674,553, hereafter '553), and Kimura (EP 0862156, hereafter '156). Ireton (U.S. Patent 4,611,539, hereafter '539) is cited as evidence.

'043 teaches a method of patterning an electroluminescent (EL) display (cols. 1-2), comprising:

flexographic printing a semiconductor polymer ink (col. 10, lines 14-28), which is the light-emitting layer (col. 7, line 13-col. 9, line 28).

Art Unit: 1762

Ireton '539 teaches that flexography is understood in the art to mean providing a flexible printing plate (i.e., a molding plate) adhered to (i.e., disposed on) a plate cylinder or printing roller (i.e., a molding roller), said molding plate having a raised image (i.e., convex and concave portions, with the convex portion (the raised image) defining lands), applying the ink to the raised portion (i.e., each land of the convex portion of the molding plate) and printing the ink from the molding plate onto a substrate by rotating the roller so that the land on each convex portion contacts the substrate.

'043 (and the definition given by Ireton) does not explicitly teach a plurality of convex and concave portions. However, '043 does indicate that different inks may be desired in different locations (col. 7, lines 12-20). Wright '081 illustrates a flexographic process and makes it clear that there may be a plurality of convex printing portions (5) and concave non-printing portions (6). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have used a flexographic plate with a plurality of convex and concave regions with a reasonable expectation of success because '043 indicates that areas with different properties are desired and because '081 teaches that a method of depositing inks in desired areas is to have a plurality of convex and concave regions.

'043 teaches that different materials may be printed in different locations, for example, to apply different colors (col. 7, lines 12-20). It does not explicitly teach the use of barrier ribs between pixels. However, the Examiner takes Official Notice that it is notoriously well known in the art of electroluminescent devices to use barrier ribs between pixels of different colors in order to provide contrast between the pixels. See, for example, '553. '553 teaches that pixel electrodes (22) may be formed between barrier ribs (29). See Fig. 20 and 22C. The selection of something based on its known suitability for its intended use has been held to support a *prima facie* case of obviousness. *Sinclair & Carroll Co. v. Interchemical Corp.*, 325 U.S. 327, 65 USPQ 297 (1945). See MPEP 2144.07. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have used the method of '043 and '081 to have printed pixels on electrodes between barrier ribs because '553 teaches that such is an operative formation for particular EL devices. The barrier layers of '553 would inherently spread.

Art Unit: 1762

'043 teaches that different materials may be printed in different locations, for example, to apply different colors (col. 7, lines 12-20). It does not explicitly teach that the colors are red, blue, and green. However, the Examiner takes Official Notice that it is notoriously well known in the art of electroluminescent devices to use red, green, and blue as the colors because red, green, and blue light can be combined to create any color of light. See, for example, '553, Figs. 1-2.

'043 does not explicitly teach that the barrier ribs are in contact with the pixel electrodes and the electroluminescent material. However, '156 teaches a method of making an EL device with active matrices (col. 1). The upper portion of the barrier ribs 240 are in contact with pixel electrode 141 and electroluminescent material 114A (Fig. 10). The selection of something based on its known suitability for its intended use has been held to support a prima facie case of obviousness. *Sinclair & Carroll Co. v. Interchemical Corp.*, 325 U.S. 327, 65 USPQ 297 (1945). Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to have formed electrode and electroluminescent material in contact with the barrier ribs with a reasonable expectation of success because '156 teaches that such configurations are suitable in the art of electroluminescent devices.

'043 teaches that the polymer may be applied in solution (col. 10, lines 14-17).

'156 also teaches that polymer may be applied in solution (col. 22, lines 29-33).

Claims 12 and 20: '553 teaches that the barrier ribs can form striped boundaries between pixels.

Claim 13: '156 teaches that an upper portion of the barrier rib overlaps an edge on the pixel electrode (Fig. 10).

Claim 14: '553 teaches that the height of the barrier rib can be larger than the combined thickness of the EL material and pixel electrode (Fig. 20).

Claim 15: '553 teaches that the spacers may be glass (SiO_2) (col. 12, lines 9-12). '156 also teaches that the barrier ribs may be SiO_2 (col. 29, lines 38-43).

Claim 16: '156 teaches that the barrier ribs can be polyimide (col. 30, lines 17-20).

Claim 18: '081 teaches that the ink may be supplied to the convex portions of the flexographic roller by rotating it and a supply roller (9) (Fig. 1, col. 3, lines 41-49).

Claim 22: '043 teaches that the layer may be 500 angstroms thick (col. 11, lines 11-13).

Claim 25: '043 teaches that the substrate may be glass (col. 12, lines 27-30).

5. Claim 19 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pei '043 in view of Wright '081, Shinoda '553, and Kimura '156 as applied to claim 9 above, and further in view of Mourrellone (U.S. Patent 4,542,693, hereafter '693).

'043, '081, and '539 teach the features of claim 18, as discussed above. '081 teaches that the amount of ink on the supply roller may be controlled, but the references do not explicitly teach causing the EL material to have a uniform thickness on the supply roller.

'693 teaches for a device comprising a letterpress (col. 1, lines 1-16) ink cylinder (T) and supply roller (A) that the provision of an equalizing roller (9) that provides an ink layer of uniform thickness on supply roller (A) (claim 8) advantageously improves the regularity of ink application and avoids the formation of undesired stripes (col. 7, lines 10-13).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have caused the EL ink of '504 to have had a uniform thickness on the supply roller by using the equalizing roller of '693 because '693 teaches that such an equalizing roller would have improved the regularity of the ink application and avoided the formation of undesired stripes.

6. Claim 21 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pei '043 in view of Wright '081, Shinoda '553, and Kimura '156 as applied to claim 9 above, and further in view of Nagayama et al. (U.S. Patent 5,701,055, hereafter '055).

'043, '081, and '553 are discussed above, but do not explicitly teach that the barrier ribs are in the form of a matrix. However, '055 teaches an alternate arrangement for spacers and EL layers of EL devices. '055 teaches that pixel electrodes (22) may be a matrix between pixels. See Figs. 1 and 19. The selection of something based on its known suitability for its intended use has been held to support a *prima facie* case of obviousness. *Sinclair & Carroll Co. v. Interchemical Corp.*, 325 U.S. 327, 65 USPQ 297 (1945). See MPEP 2144.07. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have used the method of '043 and '081 to have printed pixels on electrodes between a matrix of barrier ribs because '055 teaches that such is an operative formation for particular EL devices.

Art Unit: 1762

7. Claims 23-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pei '043 in view of Wright '081, Shinoda '553, and Kimura '156 as applied to claim 9 above, and further in view of Watanabe et al. (U.S. Patent 5,270,846, hereafter '846).

'043, '081, and '553 teach the features of claim 9, as discussed above. '081 teaches that flexographic inks assume level surfaces (col. 1, lines 23-26), but does not explicitly teach that the ink levels after printing. However, '846 also teaches that inks printed from rollers may also be leveled after printing (col. 12, lines 28-32). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have leveled the surface on the ink after printing in order to have achieved the desired thickness.

Claim 24: '043 teaches that the layers are heated after printing (col. 11, lines 11-15).

8. Claim 26 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pei '043 in view of Wright '081, Shinoda '553, and Kimura '156 as applied to claim 9 above, and further in view of Samworth (U.S. Patent 6,213,018, hereafter '018).

'043, '081, and '553 teach the features of claim 9, as discussed above. They do not explicitly teach a plurality of indentations along the lands for assisting pickup of the ink. However, '018 teaches that it is known in the art of flexographic printing to contain the inks in indentations on the surface (col. 5, lines 1-5). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have used a flexographic printer with a plurality of ink-containing indentations with a reasonable expectation of success because '018 teaches that such are suitable flexographic printers.

Response to Arguments

9. Applicant's arguments with respect to claims 9-10, 12-16, 18-27 have been considered but are moot in view of the new ground(s) of rejection.

Art Unit: 1762

Conclusion

10. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Bayer, Jr. (U.S. Patent 5,597,618) and Pappas et al. (U.S. Patent 5,162,119) are cited for their teachings regarding the relative orientation of substrates and printer rollers.

11. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jimmy Lin whose telephone number is 571-272-8902. The examiner can normally be reached on Monday thru Thursday 8 - 5:30 and Friday 8 - 4:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tim Meeks can be reached on 571-272-1423. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
